

User Guide: MidNight

Welcome to **MidNight**! This guide will help you navigate our multi-device ecosystem designed to enhance your tabletop roleplaying experience. Whether you are managing your character on your phone, checking stats on your wrist, or casting spells in virtual reality, this manual covers everything you need to know.

1. Getting Started

Before diving into your first campaign, ensure all your devices are connected and synced.

- **Create an Account:** Download the app on your smartphone and create your primary account.
 - **Pair Devices:** Go to the "Settings" tab on your phone app to pair your smartwatch and VR headset via Bluetooth/Wi-Fi.
-

2. The Smartphone Hub (Main Management)

Your smartphone is the main control center for the MidNight experience. Use it before, during, and after a session to manage campaigns, characters, quests, maps, social features, and in-game tools.

From the main menu, select one of the main options:

- **New Campaign** to create a campaign as Dungeon Master.
- **Join Campaign** to enter an existing table as a player.
- **Your Characters** to view or create characters.
- **History** to see past and active campaigns.
- **Social** to manage friends and invites.
- **News** to read app and gameplay updates.

1. Creating A Campaign As Dungeon Master

Select **New Campaign**, then fill in the campaign name, password, starting level, number of players, difficulty, and homebrew rules. After creating the campaign, you enter a lobby where you can review the campaign details and player list before starting.

2. Joining A Campaign As A Player

Select **Join Campaign**, enter your name and password, then browse the list of running campaigns. Tap a campaign to view details such as player count, difficulty, starting level, and owner. Press Join to enter the lobby.

3. Using The Lobby Before The Session Starts

The lobby shows the campaign name, type, starting level, difficulty, and current players. The Dungeon Master can start the campaign. Players can wait in the lobby until the session is unlocked.

4. Using The Map During A Session

Once the campaign starts, the session map becomes the main gameplay screen. The Dungeon Master can load or unload maps, while players can view the current map and understand markers such as enemies, allies, and objects.

5. Rolling Dice From The Phone

Open Roll Dice, select the dice type such as D4, D6, D8, D10, D12, or D20, then press Roll. The result appears instantly under Last Roll, making the phone useful for quick combat checks or ability rolls.

6. Quests Management

Open the Quests page to view quest story, reward, XP, and giver. Dungeon Masters can create or delete quests. Players can accept or refuse available quests and track their status.

7. Using Character Tools

Go to Your Characters to view saved characters or create a new one. The character builder lets you set name, class, subclass, HP, AC, level, early spells, and inventory. During a session, players can also view a simplified character dashboard with useful combat information.

8. Using Shop And Inventory Features

Players can open the shop to buy items from the shop stock or sell items from their own inventory. Dungeon Masters can manage the shop by adding item names and prices.

9. Using Dungeon Master Tools

Dungeon Masters have access to a dashboard with player stats and enemy lists. Selecting an enemy shows details such as CR, abilities, health, armor, speed, and description. DMs can also create alerts and send reminders to players.

10. Track History And Social Activity

Use History to review campaigns you played in or managed, including role, difficulty, character involved, duration, and status. Use Social to view friends, see who is online, accept or refuse requests, and invite friends to a campaign.

3. The Smartwatch Companion (Quick Actions)

The smartwatch interface acts as a compact companion for the **MidNight D&D experience**, giving the player fast access to important campaign actions without distracting them from the real-world tabletop session. The main watch face displays the campaign “**The Ashen Vault**” and offers four direct actions: **Stats, Quest, Scan, and Dice**. Each function is presented through large wearable-friendly cards, high-contrast text, and simple one-tap interactions.

- **Glanceable Vitals:**

The **Player Stats** screen allows you to quickly check your character’s current condition, including **Stamina, Hunger, Mana, and HP**. The interface also shows an active **Magic Potion Buff**, including its effect and remaining time. You can activate the buff directly from the watch or dismiss the card and return to the main screen.

- **Haptic Quest Notifications:**

The **Notifications** screen uses a stacked-card layout to show campaign updates such as urgent help requests, session reminders, and world news. When an urgent quest appears, such as “**Help Radu defeat the cave troll**”, you can immediately choose to **Accept, Decline**, or open the full details on the phone.

- **Loot Radar and Area Scan:**

The **Area Scan** screen represents haptic feedback through radar-like visual waves. When treasure is detected, the smartwatch displays key information such as **distance** and **risk level**. The player can scan again, track the discovery, or dismiss the alert. This keeps exploration fast and lightweight during gameplay.

- **Quick Dice Rolls:**

The **Dice** screen lets you rapidly select a dice type such as **D4, D6, D12, or D20** and choose the action context, such as **Attack** or **DMG**. After rolling, the result screen displays

the selected dice and the generated result, allowing quick combat or skill-check decisions without opening the phone.

- **Continue on Phone:**

For actions that need more space, such as reading full quest details or viewing the campaign map, the watch offers a **Continue on Phone** option. This keeps the smartwatch focused on quick actions while transferring complex interactions to the mobile interface.

4. The VR Immersive Tabletop (Spatial Gameplay)

The AR headset interface acts as the primary immersive layer of the AR-PI-GI experience, overlaying a fantasy HUD directly onto the user's real-world field of view. The main boot screen initializes the AR session and confirms connection status through indicators such as AR_LINK, GPS_SYNC, and QUEST_DB. Each screen maintains a consistent structure with AR corner brackets, a persistent navigation bar, and status indicators in the top-right corner.

- **Character Sheet Selection:**

The Role screen presents four playable classes — Rogue, Warrior, Mage, and Bard — as selectable cards titled "Select your Character Sheet". Each card displays the character's core stats and abilities, allowing the player to commit to their role before entering the session.

- **Active Quest HUD:**

The Quest screen is the primary in-game view. A floating quest marker appears in the center of the field of view, pointing toward the active objective with a distance indicator. The top-left displays the player's name, HP bar, and XP bar. Teammate nameplates with class labels and HP bars float above their real-world positions, color-coded by class — green for Rogue, blue for Warrior, purple for Mage. Quick action buttons for inventory, map, and combat are accessible in the bottom-right corner.

- **World Reskinning:**

The World screen activates the AR environment overlay. The real room is visually transformed into a medieval castle, with stone wall textures, torches, and banners overlaid onto physical surfaces. Each teammate is detected and labeled with a floating nameplate showing their character name and role, anchored above their real position in the room.

- **Holographic Battle Map:**

The Map screen projects a 3D holographic battlefield onto the surface of the real table. Character and enemy minifigures are placed across a glowing teal grid with forest terrain. Movement range indicators and dotted path lines show available actions. A voice

command bar at the bottom displays the active player's spoken input, such as "Move my character closer to the dragon." Turn order and party HP bars are visible in the top corners.

- **Loot and Rewards:**

The Loot screen appears upon quest completion, displaying the quest title, a summary of rewards earned, XP gained, and the player's level progression bar. Total quests completed, playtime, and current rank are shown as a summary beneath the reward panel.

5. Troubleshooting & FAQs

If you encounter issues during your adventure, check these common solutions.

- **Syncing Issues:** If your smartwatch or VR headset is not reflecting your phone's inventory, open the phone app settings and tap "Force Sync."
- **VR Tracking Lost:** Ensure your physical room is well-lit so the headset cameras can accurately track your hands and the table surface.
- **Missed Notifications:** Check that your smartwatch is not in "Do Not Disturb" mode, as this will block DM quest alerts and treasure vibrations.
- **Battery Drain:** For long sessions, we recommend keeping your smartphone plugged in, as it acts as the processing hub for the VR and watch data.

Statement of Artificial Intelligence (AI) Use

1. Project Details

Field	Details
Project/Document Title:	MidNight

Author(s)/Creator(s):	Bucur Robert, Ciobanu Matei, Grigorovici Tudor, Muscă Teodor
Institution/Organization:	Facultatea de Informatică Iași

2. AI Tools Utilized

- **Tool Name:** Google Gemini
 - **Version:** 3.1 PRO
 - **Tool Name:** Codex
 - **Version:** GPT-5.3-Codex
 - **Tool Name:** v0
 - **Version:** v0 Max
 - **Tool Name:** ChatGPT
 - **Version:** 5.5
 - **Tool Name:** StoryTribeApp
 - **Version:** -
 - **Tool Name:** lovable.dev
 - **Version/Date Used:** 2.0
 - **Tool Name:** modalverse.design Tools
 - **Version:** -
 - **Tool Name:** Claude
 - **Version:** Sonnet 4.6
-

3. Scope of AI Assistance

- **Brainstorming & Ideation:** Initially, Gemini, ChatGPT and v0 were used for ideas and prototyping the interface of our project.

- **Drafting & Content Creation:** The tools provided by the teacher on modalverse.design website were used for Research Tactics, Personas and Sitemaps. StoryTribe played a huge role in creating the layout of the storyboards, the images that were generated by the incorporated agent were replaced with the ones generated with NanoBanana by Gemini Pro.
 - **Coding & Technical Development:** The User Flow diagrams were generated in [Mermaid.js](#) language and sent to Lovable.dev to be transposed in PDF. ChatGPT helped with code generation for fixing issues in the v0 application, related to positioning and centering of some elements.
 - **Editing & Proofreading:** Gemini was used to refactor some sentences that were ultimately placed in the User Guide and some of the Personas or Research Tactics.
-

4. Human Oversight and Verification

- **Fact-Checking:** We verified the data logic (or code logic where was the case) to not have false information or weird behaviour in the prototypes.
 - **Originality:** The generated content was not taken copy-paste, there were multiple instances where more than 2 prompts were needed to shape our own personal ideas and give them life with the help of AI tools.
 - **Modifications:** Sometimes, agents would give completely wrong directions. Adjustments were needed to keep the good track and flow of our work, and we “trained” the agents to give answers based on our full project context.
-

5. Declaration of Accountability

We confirm that while Artificial Intelligence tools were used to assist in the creation of this work, we have reviewed, edited, and verified all AI-generated content. We take full responsibility for the final accuracy, integrity, and originality of this submission.
